

# Abstract

The writing of this thesis has as goal to explore and analyse feasibility to rebroadcast a physical course online. Indeed, this kind of teaching is not quite common and totally absent at the Antwerp Maritime Academy could have an enormous advantage for our school and for the students who would have an easier student life. We are living in the information era thanks to internet, and it is too bad that the education system didn't project itself into this new kind of teaching.

Nevertheless, we have to measure the advantages and the disadvantages of such a project.

To support my project, I had to analyse every aspect that composes it like, the technical aspect (materials) and the juridical aspect. To support my idea, I also inquired on similar systems, and I observed that they have favourable opinions. Surveys and an interview have also been done on purpose to get the opinion of the people concerned with this project. But also, the opinion of a teaching expert to guide us through the creation of such a project.

At the end of this Master thesis, we can observe that the implementation of a such system would be an asset for our school. A lot of arguments validate my idea, and the flaws can easily be corrected.
